ABOUT ME

Data Engineer & Analyst with 3+ years of experience designing and automating scalable data ecosystems for Telco and enterprise environments. Proven track record in building high-throughput pipelines processing millions to billions of records, architecting multi-source reporting infrastructure, and engineering AI-ready data workflows. Skilled across the full data stack — from pipeline orchestration and data modelling to cloud platforms and LLM/RAG integration. Active speaker and contributor to the Indonesian data engineering community.

CERTIFICATE & SKILL

- **Python, Shellscript, SQL:** <https://www.hackerrank.com/certificates/6ead108b3851>
- **Data Modeling, Data Architecture, Data Quality, Data Processing**
- **Cloud :** Databricks Ecosystem, GCP Ecosystem, AWS Ecosystem
- **Datawarehouse :** Postgres, MySql, Clickhouse
- **Orchrestration :** Airflow, Airbyte, Kestra
- **IELTS Academic Certification (IELTS IDP) - (CEFR level: B2) ||** <https://bit.ly/IELTSPijarHM>

WORK EXPERIENCE

Neural Technologies Indonesia

(February 2025 – Present)

Data Engineer – Full-time

- Processed and engineered massive-scale Telco data from heterogeneous sources (millions to billions of records), maintaining high-performance relational schemas with Star/Snowflake models.
- Designed automated end-to-end data pipelines with proactive quality frameworks — anomaly detection at ingestion layer ensures high-fidelity data for business analytics.

Key Projects :

- **Real-Time KPI Pipeline for POI (Point of Interest) — 15-Minute Update Cycle**
 - Architected a high-frequency data pipeline capable of refreshing KPI metrics across millions of rows every 15 minutes for geo-tagged Points of Interest.
 - Designed incremental ingestion logic and optimised indexing strategies to handle burst load without degrading downstream query performance.
 - Enabled near-real-time business monitoring of location-based KPIs for Telco operational decision-making.
- **Multi-Source Management Reporting Dashboard**
 - Built centralised reporting infrastructure aggregating data from traditional on-premise servers, cloud platforms, and hybrid sources into a unified analytical layer.
 - Engineered transformation and normalisation pipelines to reconcile schema differences across heterogeneous source systems handling millions of records.
 - Delivered a single-pane-of-glass dashboard enabling management to track cross-domain metrics in one consistent view.
- **Payment Payload Collection & AI-Readiness Dashboard**
 - Developed a data collection and reconciliation system for partner payment payloads, cross-matching incoming data against internal databases and multiple external partner systems.
 - Implemented automated discrepancy detection and validation workflows to ensure data accuracy before further processing.
 - Processed and structured user feedback data for AI-readiness, preparing clean, labelled datasets suitable for downstream machine learning and LLM pipelines.

Tuwaiaq Turk

(June 2024 – Aug 2024)

Businesses Intelligence – Remote Internship

- Contributed on making studies problem analysis of international student around several country
- Contributed on design travel trip strategy for international student preference

id/x Partner

(Dec 2023 – Jan 2024)

Data Engineer - Remote Internship

- Contributed on making ETL pipeline and orchestration for customer and order database
- Design flowchart of data pipeline from raw data imported to database management

EDUPEDIA Publisher

(Sept 2022 – Sept 2023)

Database Developer – Full-time

- Handle database of customer relation for publishing scientific journals and academic book

-
- Manage database of design and promote e-journal websites through customer e-mail
 - Analyse customer order behaviour in scientific publication in specific amount of time

Kojo Cloth

(Sept 2019-2020)

Data Manager Clerk – Full-time

- Contributed to make raw material database for cloth production cost
- Monitoring raw material and order process flow to final product
- Analyse correlation between favourites material and customer order in market to make assist business insight

EDUCATION

UNIVERSITAS PADJADJARAN

Bachelor of Science

Project: Sea Wave Prediction using Artificial Neural Networks: Developed an ANN-based predictive model to forecast ocean wave patterns, enabling proactive insights for maritime and coastal management applications.

IPB UNIVERSITY

Master of Science

Project: DNA Tree Clustering of Shark Species: Applied hierarchical clustering on thousands of shark DNA sequences from a multi-species database to identify phylogenetic gaps and assess genetic divergence between species
